Bolt — Engineering Team

Re: Senior Full Stack Engineer (Tallinn, Estonia)

Dear Hiring Team,

I am applying for the Senior Full Stack Engineer role at Bolt in Tallinn. My background centers on building full-stack products across TypeScript, Node.js, and React, alongside embedding AI coding agents into daily team workflows to ship faster without compromising standards.

At Alfa-Dengi, a consumer-lending marketplace, I built product features across the full application lifecycle, from database schema design to frontend interfaces. When our business launched consumer credit reports, I led three engineers through technical design, user flows, API contracts, and an external credit bureau integration querying a 6-million-row dataset. We scoped the launch to a minimal, testable flow and aligned closely with product managers. The service turned profitable in its first week, increasing net profit by 40% and doubling revenue per click from roughly \$1.9 to \$3.8 before rolling out across two more brands. On the frontend, I developed a status-driven campaign builder on React and NestJS generating about \$80,000 monthly, allowing non-technical teammates to manage workflows independently.

To keep services performant under heavy traffic, I reworked the data access path for our lead-scoring table of 100,000 rows. By combining query profiling, server-side pagination, and PostgreSQL index optimization, I reduced query latency from eight seconds down to under one second while preserving all filters. When promotional spikes caused message drops, I moved event delivery to Apache Kafka, establishing an asynchronous event backbone with zero message loss.

Bolt's baseline expectation of using AI daily aligns with how I work every day. For the past two years, I have made Claude Code an integral part of engineering: authoring project architectural rules, developing custom MCP servers over database schemas and internal documentation, and introducing an agentic pre-review stage before human code review. This reduced typical CRUD module delivery with tests from roughly two hours to about forty minutes.

My daily stack includes TypeScript, Node.js with NestJS and Express, React, PostgreSQL, Redis, and Docker. I am based in Yerevan, Armenia (GMT+4) and am fully prepared to relocate to Tallinn, Estonia, working remotely with full European overlap until relocation.

As Bolt expands multi-modal mobility across 50 countries, how do your product teams balance shared core microservices with city-specific business logic across ride-hailing and delivery verticals?

Kind regards,

Ivan Shabanov
