ServiceTitan — Engineering Hiring Team

Re: Senior Software Engineer, Test (Org Modeling) — JR114182

Dear Hiring Team,

I am applying for the Senior Software Engineer, Test role on the Org Modeling team. Over the past four years, my work has focused on architecting automated quality systems, testing infrastructure, and developer tooling across TypeScript, Node.js, and PostgreSQL.

At Alfa-Dengi, my priority was moving quality checks as close to code creation as possible by embedding automated verification directly into the daily engineering cycle. I authored our project rules for Claude Code, built custom MCP servers exposing database schemas and task trackers to agents, and introduced an agentic pre-review stage before human pull request reviews. This system verified schema compliance and test coverage automatically, cutting delivery of a typical CRUD module with tests from roughly two hours to about forty minutes while keeping pull requests clean. For external integrations, I led API contract testing for a team of three engineers integrating credit bureau services over a 6-million-row dataset, ensuring data correctness for a product that turned profitable in its first week and lifted net profit by 40%.

I apply the same systems thinking to performance and integration testing. When high volume slowed our lead-scoring table at Alfa-Dengi, I paired database query and index optimization with server-side pagination, cutting load latency on a 100,000-row dataset from eight seconds down to under one second. To verify message integrity under peak promotional traffic, I routed delivery through Apache Kafka, which eliminated message loss. At Appbooster, I modeled an asynchronous moderation queue with anti-fraud rules, making 100% of payouts auditable across hundreds of daily completions.

My testing stack centers on Playwright for browser flows, alongside Vitest, Jest, and Supertest for unit, integration, and API contract validation. I instrument observability with OpenTelemetry tracing and Grafana alerts, ensuring that automated pipelines in GitHub Actions and GitLab CI/CD provide fast, actionable signals directly to developers.

I work remotely from Yerevan, Armenia (GMT+4) via B2B contract or EOR, maintaining substantial working overlap with United States East Coast business hours.

As your squad models organizational structures across 50,000 active businesses, what is currently your team's greatest quality challenge: verifying data migration consistency across complex organizational hierarchies, or isolating cross-service contract regressions in continuous integration?

Kind regards,

Ivan Shabanov
