TradingView — Frontend Engineering Hiring Team

Re: Senior Frontend Developer (Limassol, Cyprus)

Dear Hiring Team,

I am applying for the Senior Frontend Developer role in Limassol. Over the past four years, my work has centered on architecting data-intensive web applications, complex state machines, and high-performance interfaces using React and TypeScript.

At Alfa-Dengi, our internal lead-scoring dashboard handles tables of 100,000 rows with 9,000 new records arriving daily, where initial load times previously reached eight seconds. I profiled rendering bottlenecks and re-render frequency, implementing client-side DOM row virtualization so that only visible rows exist in memory and on screen. Paired with server-side pagination and database indexing, this optimization reduced load latency to under one second while maintaining instant responsiveness across complex filtering operations. For our marketing platform, I engineered a visual campaign builder on React and NestJS. I structured the document model on a normalized Redux Toolkit store with immutable state updates, supporting drag-and-drop canvas steps, branching logic, and undo and redo capabilities, which generated about \$80K per month with zero developer dependency.

I bring that same rigor to product interfaces and runtime performance. At Appbooster, I built a responsive user dashboard on a normalized store with optimistic state updates and a live verification queue, helping the product grow to 1,000 daily active users in three months. At SODA, I optimized bundle sizes and Core Web Vitals across single-page applications, raising Lighthouse Performance from 58 to 87 and lifting conversion about 1.5 times.

My frontend approach pairs strict TypeScript types with modular, reusable component architecture and automated tests in Playwright and Vitest. I have connected React clients to live WebSocket streams over Apache Kafka events, ensuring that state updates remain fluid and deterministic under continuous data feeds.

I am based in Yerevan, Armenia (GMT+4) and fully prepared to relocate to Limassol with TradingView's relocation support, with full European timezone overlap during any remote transition.

With TradingView rendering high-frequency market data for millions of traders daily, where is your frontend team currently focusing most: minimizing re-render cycles during rapid WebSocket tick bursts, or optimizing memory consumption across complex multi-chart layouts?

Kind regards,

Ivan Shabanov
