TradingView — Product Leadership Team

Re: Senior Product Manager (Limassol, Tbilisi)

Dear Hiring Team,

I am applying for the Senior Product Manager position at TradingView in Limassol or Tbilisi. My experience combines customer-facing product ownership in fintech, rigorous data-driven experimentation, and the technical depth required to build complex analytical and financial tools.

At Alfa-Dengi, a financial marketplace processing high-volume traffic, I led the discovery, definition, and rollout of a consumer credit-report product. Rather than building a sprawling roadmap upfront, I worked closely with marketing and engineers to cut scope down to a minimal, testable funnel that validated core borrower demand. We launched the initial version over an external bureau integration and a 6-million-row dataset. The product turned profitable in its first week, increasing net profit by 40% and doubling earnings per click from roughly \$1.9 to \$3.8. Following structured A/B testing on pricing and presentation tiers, we rolled the product out across two additional partner brands. Alongside this, I designed a status-driven campaign builder that generates about \$80,000 monthly, allowing marketing teams to launch automated campaigns independently.

My approach to product management is rooted in measurable behavioral data. At SODA, when evaluating an automated lead-processing assistant, I ran a three-month controlled experiment comparing human managers, hybrid teams, and automated agents on identical funnel conversion rates. The automated channel outperformed human benchmarks every month, reducing response latency to under thirty seconds and tripling monthly revenue from about \$47,000 to approximately \$141,000. At Appbooster, I shifted acquisition evaluation from raw installs to retained active users through comprehensive attribution modeling, growing an engagement platform to 1,000 daily active users in three months.

Because of my engineering background, I communicate effectively with developers and designers on technical trade-offs, whether optimizing Core Web Vitals to lift conversion by approximately 50% or designing real-time WebSocket data updates.

I am based in Yerevan, Armenia (GMT+4) and am fully prepared to relocate to Limassol, Cyprus or Tbilisi, Georgia, working remotely with full European overlap until relocation.

As TradingView deepens the integration between professional charting analytics and social publishing features, how do your product teams evaluate the trade-off between power-user customization and onboarding conversion for new retail investors?

Kind regards,

Ivan Shabanov
